

To whom it may concern:

In the years prior to the construction of my new facility, few options were available to me for my floors. As a metal machining and fabrication company, we are hard on the concrete. We previously used epoxy coatings to provide enhanced cleanability and aesthetics. However, while we were relatively pleased with our epoxy coatings, we did find that their aesthetics decreased quite quickly and that their lifespan was limited thereby requiring maintenance and recoating.

As we began construction of our new facility, we were introduced to new technology called the Retro Plate System™. This system promised to provide greater durability, cleanability, longevity and aesthetics for our requirements. We chose to have this system installed and have found the results very pleasing.

The concrete treated with the Retro Plate System™ is very durable, easy to clean and its aesthetics and shine have not decreased with traffic and use over time.

I would highly recommend this system and would use it again if the opportunity presented itself.

Sincerely,

Ron Bender
President
RJB Machining Ltd.
